6.26	AT+CCINFO	Show cell system information	124
6.27	AT+CSCHN	Show cell channel information	126
6.28	AT+CSRP	Show serving cell radio parameter	127
6.29	AT+CRUS	Show cell set system information	128
6.30	AT+CPLMNWLST	Manages PLMNs allowed by customer	130
6.31	AT+CPASSMGR	Manage password	130
6.32	AT+CNSVSQ	Network band scan quickly	131
6.33	AT+CNSVS	Network full band scan in string format	132
6.34	AT+CNSVN	Network full band scan in numeric format	135
6.35	AT+CNSVUS	Network band scan by channels in string	138
6.36	AT+CNSVUN	Network band scan by channels in numeric	140
7	Mobile Equipment Control and Status Commands		143
7.1	+CME ERROR	Mobile Equipment error result code	143

7.2	AT+CMEE Report mobile equipment error	146
7.3	AT+CPAS Phone activity status.....	147
7.4	AT+CFUN Set phone functionality	148
7.5	AT+CPIN Enter PIN.....	149
7.6	AT+CSQ Signal quality	150
7.7	AT+AUTOCSQ Set CSQ report.....	151
7.8	AT+CACM Accumulated call meter	152
7.9	AT+CAMM Accumulated call meter maximum	153
7.10	AT+CPUC Price per unit and currency table	154
7.11	AT+CPOF Control phone to power down	155
7.12	AT+CCLK Real time clock	155
7.13	AT+CRFEN RF check at initialization	156
7.14	AT+CRESET Reset ME	157
7.15	AT+SIMEI Set module IMEI.....	158
7.16	AT+CSIMLOCK Request and change password	159
7.17	AT+DSWITCH Change diagnostics port mode	161
7.18	AT+CNVW Write NV item	161
7.19	AT+CNVR Read NV item	163
7.20	AT+CDELTA Write delta package to FOTA partition	165
7.21	AT+CDIPR Set UART baud rate	166
7.22	AT+CUDIAG Switch UART from AT service to DIAG service	167
8	SIMCard Related Commands.....	169
8.1	AT+CICCID Read ICCID in SIM card.....	169
8.2	AT+CSIM Generic SIM access	169
8.3	AT+CRSM Restricted SIM access.....	170
8.4	AT+CSIMSEL Switch between two SIM card	172
8.5	AT+SPIC Times remain to input SIM PIN/PUK	173
8.6	AT+CSPN Get service provider name from SIM.....	173
9	Hardware Related Commands.....	175
9.1	AT+CTXGAIN Set TX gain	175
9.2	AT+CRXGAIN Set RX gain	175
9.3	AT+CTXVOL Set TX volume.....	176
9.4	AT+CRXVOL Set RX volume	177
9.5	AT+CTXFTR Set TX filter	177
9.6	AT+CRXFTR Set RX filter.....	178
9.7	AT+CVALARM Low voltage Alarm	179
9.8	AT+CRIIC Read values from register of IIC device.....	180
9.9	AT+CWIIC Write values to register of IIC device	181
9.10	AT+CVAUXS Set state of the pin named VREG_AUX1.....	181
9.11	AT+ CVAUXV Set voltage value of the pin named VREG_AUX1	182
9.12	AT+CGPIO Set Trigger mode of interrupt GPIO	183
9.13	AT+CGDRT Set the direction of specified GPIO.....	184

9.14	AT+CGSETV Set the value of specified GPIO.....	185
9.15	AT+CGGETV Get the value of specified GPIO.....	185
9.16	AT+CADC Read ADC value	186
9.17	AT+CMICAMP1 Set value of micamp1	187
9.18	AT+CVLVL Set value of sound level.....	188
9.19	AT+SIDET Digital attenuation of sidetone.....	189
9.20	AT+CECM Enable/Disable Echo Canceller.....	190
9.21	AT+CNSM Enable/Disable Noise Suppression	191
9.22	AT+CECSET Adjust the effect for the given echo cancellation mode	192
9.23	AT+CRIRS Reset RI pin of serial port	193
9.24	AT+CSUART Switch UART line mode.....	194
9.25	AT+CDCDMD Set DCD pin mode	195
9.26	AT+CDCDVL Set DCD pin high-low in GPIO mode	195
9.27	AT+CBC Battery charge	196
9.28	AT+CDTRISRMD Configure the trigger condition for DTR's interrupt.	197
9.29	AT+CDTRISRS Enable/disable the pin of DTR's awakening function	198
9.30	AT+CGFUNC Enable/disable the function for the special GPIO.....	199
9.31	AT+CGWHOST Reset GPIO 41 to high level.....	200
9.32	AT+CGWISRMD Configure the trigger condition for GPIO43's.....	201
9.33	AT+CKGSWT Switch pins' function	202
9.34	+KEY Keypad result code.....	203
9.35	AT+CADC read internal ADC value	204
9.36	AT+CUSBSPD Switch USB high or full speed.....	205
9.37	AT+CLEDITST Adjust the LED's intensity	206
10	SPI Related Commands	208
10.1	AT+CSPISETCLK SPI clock rate setting	208
10.2	AT+CSPISETCS SPI chip select setting	209

1 Introduction

1.1 Scope

The present document describes the AT Command Set for the SIMCom Module:

SIM5320

More information about the SIMCom Module which includes the Software Version information can be retrieved by the command [ATI](#). In this document, a short description, the syntax, the possible setting values and responses, and some examples of AT commands are presented.

Prior to using the Module, please read this document and the Version History to know the difference from the previous document.

In order to implement communication successfully between Customer Application and the Module, it is recommended to use the AT commands in this document, but not to use some commands which are not included in this document.

1.2 References

The present document is based on the following standards:

- [1] ETSI GSM 01.04: Abbreviations and acronyms.
- [2] 3GPP TS 27.005: Use of Data Terminal Equipment – Data Circuit terminating Equipment (DTE – DCE) interface for Short Message Service (SMS) and Cell Broadcast Service (CBS).

1.3 Terms and abbreviations

For the purposes of the present document, the following abbreviations apply:

- AT ATtention; the two-character abbreviation is used to start a command line to be sent from TE/DTE to TA/DCE
- CSD Circuit Switched Data
- DCE Data Communication Equipment; Data Circuit terminating Equipment
- DCS Digital Cellular Network
- DTE Data Terminal Equipment
- DTMF Dual Tone Multi-Frequency
- EDGE Enhanced Data GSM Environment
- EGPRS Enhanced General Packet Radio Service
- GPIO General-Purpose Input/Output

▪ GPRS	General Packet Radio Service
▪ GSM	Global System for Mobile communications
▪ HSDPA	High Speed Downlink Packet Access
▪ HSUPA	High Speed Uplink Packet Access
▪ I2C	Inter-Integrated Circuit
▪ IMEI	International Mobile station Equipment Identity
▪ IMSI	International Mobile Subscriber Identity
▪ ME	Mobile Equipment
▪ MO	Mobile-Originated
▪ MS	Mobile Station
▪ MT	Mobile-Terminated; Mobile Termination
▪ PCS	Personal Communication System
▪ PDU	Protocol Data Unit
▪ PIN	Personal Identification Number
▪ PUK	Personal Unlock Key
▪ SIM	Subscriber Identity Module
▪ SMS	Short Message Service
▪ SMS-SC	Short Message Service – Service Center
▪ TA	Terminal Adaptor; e.g. a data card (equal to DCE)
▪ TE	Terminal Equipment; e.g. a computer (equal to DTE)
▪ UE	User Equipment
▪ UMTS	Universal Mobile Telecommunications System
▪ USIM	Universal Subscriber Identity Module
▪ WCDMA	Wideband Code Division Multiple Access
▪ FTP	File Transfer Protocol
▪ HTTP	Hyper Text Transfer Protocol
▪ POP3	Post Office Protocol Version 3
▪ POP3 client	An client that can receive e-mail from POP3 server over TCP session
▪ RTC	Real Time Clock
▪ SMTP	Simple Mail Transfer Protocol
▪ SMTP client	An client that can transfer text-based e-mail to SMTP server over TCP session
▪ URC	Unsolicited Result Code
▪ MMS	Multimedia message system

1.4 Definitions and conventions

- For the purposes of the present document, the following syntactical definitions apply:

<CR>	Carriage return character.
<LF>	Linefeed character.
<...>	Name enclosed in angle brackets is a syntactical element. Brackets themselves do not appear in the command line.
[...]	Optional subparameter of AT command or an optional part of TA information response

is enclosed in square brackets. Brackets themselves do not appear in the command line. If subparameter is not given, its value equals to its previous value or the recommended default value.

underline Underlined defined subparameter value is the recommended default setting or factory setting.

2. Document conventions:

- ◆ Display the examples of AT commands with *Italic* format.
- ◆ Not display *blank-line* between command line and responses or inside the responses.
- ◆ Generally, the characters <CR> and <LF> are intentionally omitted throughout this document.
- ◆ If command response is ERROR, not list the ERROR response inside command syntax.

NOTE AT commands and responses in figures may be not following above conventions.

3. Special marks for commands or parameters:

SIM PIN – Is the command PIN protected?

YES – AT command can be used only when SIM PIN is READY.

NO – AT command can be used when SIM card is absent or SIM PIN validation is pending.

References – Where is the derivation of command?

3GPP TS 27.007 – 3GPP Technical Specification 127 007.

V.25ter – ITU-T Recommendation V.25ter.

Vendor – The command is supported by SIMCom.

2 AT Interface Synopsis

2.1 Interface settings

Between Customer Application and the Module, standardized RS-232 interface is used for the communication, and default values for the interface settings as following:

115200bps, 8 bit data, no parity, 1 bit stop, no data stream control.

2.2 AT command syntax

The prefix “AT” or “at” (no case sensitive) must be included at the beginning of each command line (except [A/](#) and [+++](#)), and the character <CR> is used to finish a command line so as to issue the command line to the Module. It is recommended that a command line only includes a command.

When Customer Application issues a series of AT commands on separate command lines, leave a pause between the preceding and the following command until information responses or result codes are retrieved by Customer Application, for example, “OK” is appeared. This advice avoids too many AT commands are issued at a time without waiting for a response for each command.

In the present document, AT commands are divided into three categories: Basic Command, S Parameter Command, and Extended Command.

1. Basic Command

The format of Basic Command is “[AT](#)<x><n>” or “[AT](#)&<x><n>”, “<x>” is the command name, and “<n>” is/are the parameter(s) for the basic command, and optional. An example of Basic Command is “[ATE](#)<n>”, which informs the TA/DCE whether received characters should be echoed back to the TE/DTE according to the value of “<n>”; “<n>” is optional and a default value will be used if omitted.

2. S Parameter Command

The format of S Parameter Command is “[ATS](#)<n>=<m>”, “<n>” is the index of the S-register to set, and “<m>” is the value to assign to it. “<m>” is optional; in this case, the format is “[ATS](#)<n>”, and then a default value is assigned.

3. Extended Command

The Extended Command has several formats, as following table list:

Table 2-1: Types of Extended Command

Command Type	Syntax	Comments
Test Command	AT+<NAME>=?	Test the existence of the command; give some information about the command subparameters.

Read Command	AT+<NAME>?	Check the current values of subparameters.
Write Command	AT+<NAME>=<...>	Set user-definable subparameter values.
Execution Command	AT+<NAME>	Read non-variable subparameters determined by internal processes.

NOTE The character “+” between the prefix “AT” and command name may be replaced by other character. For example, using “#” or “\$” instead of “+”.

2.3 Information responses

If the commands included in the command line are supported by the Module and the subparameters are correct if presented, some information responses will be retrieved by from the Module. Otherwise, the Module will report “ERROR” or “+CME ERROR” or “+CMS ERROR” to Customer Application.

Information responses start and end with <CR><LF>, i.e. the format of information responses is “<CR><LF><response><CR><LF>”. Inside information responses, there may be one or more <CR><LF>. Throughout this document, only the responses are presented, and <CR><LF> are intentionally omitted.

3 General Commands

3.1 ATI Display product identification information

Description

The command requests the product information, which consists of manufacturer identification, model identification, revision identification, QCN type, International Mobile station Equipment Identity (IMEI) and overall capabilities of the product.

SIM PIN	References
NO	V.25ter

Syntax

Execution Command	Responses
ATI	Manufacturer: <manufacturer> Model: <model> Revision: <revision> QCN: [<qcn_type>] IMEI: <sn> +GCAP: list of <name>s OK

Defined values

<manufacturer>
The identification of manufacturer.
<model>
The identification of model.
<revision>
The revision identification of firmware.
<qcn_type>
The identification of QCN. QCN is used to save non-volatile values for software.
<sn>
Serial number identification, which consists of a single line containing IMEI (International Mobile station Equipment Identity) number.
<name>
List of additional capabilities:
+CGSM GSM function is supported
+FCLASS FAX function is supported
+DS Data compression is supported
+ES Synchronous data mode is supported.

Examples

```
ATI
Manufacturer: SIMCOM INCORPORATED
Model: SIMCOM_SIM5320
Revision: 1575B01SIM5320
SIM5320_1575_101215_V1.00
QCN:
IMEI: 351602000330570
+GCAP: +CGSM,+FCLASS,+DS
OK
```

3.2 AT+CGMI Request manufacturer identification

Description

The command requests the manufacturer identification text, which is intended to permit the user of the Module to identify the manufacturer.

SIM PIN	References
NO	3GPP TS 27.007

Syntax

Test Command	Responses
AT+CGMI=?	OK
Execution Command	Responses
AT+CGMI	<manufacturer> OK

Defined values

<manufacturer>
The identification of manufacturer.

Examples

```
AT+CGMI
SIMCOM INCORPORATED
OK
```

3.3 AT+CGMM Request model identification

Description

The command requests model identification text, which is intended to permit the user of the Module to identify the specific model.

SIM PIN	References
NO	3GPP TS 27.007

Syntax

Test Command	Responses
AT+CGMM=?	OK
Execution Command	Responses
AT+CGMM	<model> OK

Defined values

<model>
The identification of model.

Examples

AT+CGMM
SIMCOM_SIM5320
OK

3.4 AT+CGMR Request revision identification

Description

The command requests product firmware revision identification text, which is intended to permit the user of the Module to identify the version, revision level, date, and other pertinent information.

SIM PIN	References
NO	3GPP TS 27.007

Syntax

Test Command	Responses
AT+CGMR=?	OK
Execution Command	Responses
AT+CGMR	<revision> OK

Defined values

<revision>

The revision identification of firmware.

Examples

AT+CGMR

+CGMR: 1575B01SIM5320

OK

3.5 AT+CGSN Request product serial number identification

Description

The command requests product serial number identification text, which is intended to permit the user of the Module to identify the individual ME to which it is connected to.

SIM PIN	References
NO	3GPP TS 27.007

Syntax

Test Command	Responses
AT+CGSN=?	OK
Execution Command	Responses
AT+CGSN	<sn> OK

Defined values

<sn>

Serial number identification, which consists of a single line containing the IMEI (International Mobile station Equipment Identity) number of the MT.

Examples

AT+CGSN

351602000330570

OK

3.6 AT+CSCS Select TE character set

Description

Write command informs TA which character set `<chset>` is used by the TE. TA is then able to convert character strings correctly between TE and MT character sets.

Read command shows current setting and test command displays conversion schemes implemented in the TA.

SIM PIN	References
YES	3GPP TS 27.007

Syntax

Test Command	Responses
AT+CSCS=?	+CSCS: (list of supported <code><chset></code> s) OK
Read Command	Responses
AT+CSCS?	+CSCS: <code><chset></code> OK
Write Command	Responses
AT+CSCS= <code><chset></code>	OK ERROR
Execution Command	Responses
AT+CSCS	<i>Set subparameters as default value:</i> OK

Defined values

<code><chset></code>
Character set, the definition as following:
“IRA” International reference alphabet.
“GSM” GSM default alphabet; this setting causes easily software flow control (XON /XOFF) problems.
“UCS2” 16-bit universal multiple-octet coded character set; UCS2 character strings are converted to hexadecimal numbers from 0000 to FFFF.

Examples

AT+CSCS="IRA"
OK
AT+CSCS?
+CSCS:"IRA"
OK

3.7 AT+CIMI Request international mobile subscriber identity

Description

Execution command causes the TA to return **<IMSI>**, which is intended to permit the TE to identify the individual SIM card which is attached to MT.

SIM PIN	References
YES	3GPP TS 27.007

Syntax

Test Command	Responses
AT+CIMI=?	OK
Execution Command	Responses
AT+CIMI	<IMSI> OK

Defined values

<IMSI>
International Mobile Subscriber Identity (string, without double quotes).

Examples

<i>AT+CIMI</i>
460010222028133
OK

3.8 AT+GCAP Request overall capabilities

Description

Execution command causes the TA reports a list of additional capabilities.

SIM PIN	References
YES	V.25ter

Syntax

Test Command	Responses
AT+GCAP=?	OK
Execution Command	Responses
AT+GCAP	+GCAP: (list of <name> s) OK

Defined values

<name>

List of additional capabilities.

+CGSM	GSM function is supported
+FCLASS	FAX function is supported
+DS	Data compression is supported
+ES	Synchronous data mode is supported.

Examples

AT+GCAP

+GCAP:+CGSM,+FCLASS,+DS

OK

3.9 AT+CATR Configure URC destination interface

Description

The command is used to configure the interface which will be used to output URCs.

SIM PIN	References
NO	Vendor

Syntax

Test Command	Responses
AT+CATR=?	+CATR: (list of supported <port>s),(list of supported <save>s) OK
Read Command	Responses
AT+CATR?	+CATR: <port> OK
Write Command	Responses
AT+CATR=<port>[,<save>]	OK ERROR

Defined values

<port>

0	– all ports
1	– use UART port to output URCs
2	– use MODEM port to output URCs
3	– use ATCOM port to output URCs

<save>

0	– set temporarily
1	– set permanently

Examples

```
AT+CATR=1,0
```

```
OK
```

```
AT+CATR?
```

```
+CATR: 1
```

```
OK
```

3.10 A/ Repeat last command

Description

The command is used for implement previous AT command repeatedly (except A/), and the return value depends on the last AT command. If A/ is issued to the Module firstly after power on, the response “OK” is only returned.

References

V.25ter

Syntax

Execution Command	Responses
A/	<i>The response the last AT command return</i>

Examples

```
AT+GCAP
```

```
+GCAP:+CGSM,+FCLASS,+DS
```

```
OK
```

```
A/
```

```
+GCAP:+CGSM,+FCLASS,+DS
```

```
OK
```

3.11 AT+CFGRI Indicate RI when using URC

Description

The command is used to config whether pulling down the RI pin of UART when URC reported. If **<status>** is 1, host may be wake up by RI pin.

SIM PIN	References
NO	Vendor

Syntax

Test Command	Responses
AT+CFGRI=?	+CFGRI: (range of supported <status>s), (range of supported <save>s) OK
Read Command	Responses
AT+CFGRI?	+CFGRI: <status>, <save> OK
Write Command	Responses
AT+CFGRI=<status>[,<save>]	OK ERROR
Execution Command	Responses
AT+CFGRI	Set <status> = 1,<save> = 0: OK

Defined values

<status>
0 off
1 on
<save>
0 <status> not saved in nonvolatile memory
1 <status> saved in nonvolatile memory.After it resets, <status> still takes effect.

Examples

AT+CFGRI=?
+CFGRI: (0-1),(0-1)
OK
AT+CFGRI?
+CFGRI: 0,0
OK
AT+CFGRI=1,1
OK
AT+CFGRI
OK

4 Call Control Commands and Methods

4.1 AT+CSTA Select type of address

Description

Write command is used to select the type of number for further dialing commands ([ATD](#)) according to GSM/UMTS specifications.

Read command returns the current type of number.

Test command returns values supported by the Module as a compound value.

SIM PIN	References
YES	3GPP TS 27.007

Syntax

Test Command	Responses
AT+CSTA=?	+CSTA:(list of supported <type>s) OK
Read Command	Responses
AT+CSTA?	+CSTA:< type > OK
Write Command	Responses
AT+CSTA= <type>	OK ERROR
Execution Command	Responses
AT+CSTA	OK

Defined values

<type>
Type of address octet in integer format:
145 – when dialling string includes international access code character “+”
161 – national number. The network support for this type is optional
177 – network specific number, ISDN format
129 – otherwise
NOTE Because the type of address is automatically detected on the dial string of dialing command, command AT+CSTA has really no effect.

Examples

AT+CSTA?
+CSTA: 129

```
OK
AT+CSTA=145
OK
```

4.2 AT+CMOD Call mode

Description

Write command selects the call mode of further dialing commands ([ATD](#)) or for next answering command ([ATA](#)). Mode can be either single or alternating.

Test command returns values supported by the TA as a compound value.

SIM PIN	References
NO	3GPP TS 27.007

Syntax

Test Command	Responses
AT+CMOD=?	+CMOD: (list of supported <mode> s) OK
Read Command	Responses
AT+CMOD?	+CMOD: <mode> OK
Write Command	Responses
AT+CMOD= <mode>	OK ERROR
Execution Command	Responses
AT+CMOD	<i>Set default value:</i> OK

Defined values

[<mode>](#)

0 – single mode(only supported)

NOTE The value of [<mode>](#) shall be set to zero after a successfully completed alternating mode call. It shall be set to zero also after a failed answering. The power-on, factory and user resets shall also set the value to zero. This reduces the possibility that alternating mode calls are originated or answered accidentally.

Examples

```
AT+CMOD?
+CMOD: 0
```

```
OK
AT+CMOD=0
OK
```

4.3 ATD Dial command

Description

The dial command lists characters that may be used in a dialling string for making a call or controlling supplementary services.

SIM PIN	References
YES	V25.ter

Syntax

Execution Commands	Responses
ATD<n>[<mgsms>][;]	OK VOICE CALL: BEGIN
	<i>Originate a call unsuccessfully:</i> NO CARRIER

Defined values

<n>
String of dialing digits and optionally V.25ter modifiers dialing digits: 0 1 2 3 4 5 6 7 8 9 * # + A B C
Following V.25ter modifiers are ignored: , T P ! W @
<mgsms>
String of GSM modifiers: I Activates CLIR (disables presentation of own phone number to called party) i Deactivates CLIR (enables presentation of own phone number to called party) G Activate Closed User Group explicit invocation for this call only g Deactivate Closed User Group explicit invocation for this call only
<;>
The termination character ";" is mandatory to set up voice calls. It must not be used for data and fax calls.

Examples

```
ATD10086;
OK
VOICE CALL:BEGIN
```

4.4 ATD<mem><n> Originate call from specified memory

Description

Originate a call using specified memory and index number.

SIM PIN	References
YES	V.25ter

Syntax

Execution Commands	Responses
ATD<mem><n>[:]	OK
	VOICE CALL: BEGIN
	<i>Originate a call unsuccessfully:</i>
	NO CARRIER

Defined values

<mem>	
Phonebook storage: (For detailed description of storages see AT+CPBS)	
"DC"	ME dialed calls list
"MC"	ME missed (unanswered received) calls list
"RC"	ME received calls list
"SM"	SIM phonebook
"ME"	UE phonebook
"FD"	SIM fixed dialing phonebook
"ON"	MSISDN list
"LD"	Last number dialed phonebook
"EN"	Emergency numbers
<n>	
Integer type memory location in the range of locations available in the selected memory, i.e. the index returned by AT+CPBR .	
<:>	
The termination character ";" is mandatory to set up voice calls. It must not be used for data and fax calls.	

Examples

ATD>SM3;
OK
VOICE CALL: BEGIN

4.5 ATD<n> Originate call from active memory (1)

Description

Originate a call to specified number.

SIM PIN	References
YES	V.25ter

Syntax

Execution Commands	Responses
ATD><n>[:]	OK VOICE CALL: BEGIN
	<i>Originate a call unsuccessfully:</i> NO CARRIER

Defined values

<n>

Integer type memory location in the range of locations available in the selected memory, i.e. the index number returned by [AT+CPBR](#).

<;>

The termination character ";" is mandatory to set up voice calls. It must not be used for data and fax calls.

Examples

ATD>2;

OK

VOICE CALL: BEGIN

4.6 ATD><str> Originate call from active memory (2)

Description

Originate a call to specified number.

SIM PIN	References
YES	V.25ter

Syntax

Execution Commands	Responses
ATD><str>[:]	OK VOICE CALL: BEGIN
	<i>Originate a call unsuccessfully:</i>

	NO CARRIER
--	------------

Defined values

<str>

String type value, which should equal to an alphanumeric field in at least one phone book entry in the searched memories. <str> formatted as current TE character set specified by [AT+CSCS.<str>](#) must be double quoted.

<;>

The termination character ";" is mandatory to set up voice calls. It must not be used for data and fax calls.

Examples

ATD>"Kobe";

OK

VOICE CALL: BEGIN

4.7 ATA Call answer

Description

The command is used to make remote station to go off-hook, e.g. answer an incoming call. If there is no an incoming call and entering this command to TA, it will be return "[NO CARRIER](#)" to TA.

SIM PIN	References
YES	V.25ter

Syntax

Execution Commands	Responses
ATA	<i>For voice call:</i> OK VOICE CALL: BEGIN
	<i>For data call, and TA switches to data mode:</i> CONNECT
	<i>No connection or no incoming call:</i> NO CARRIER

Examples

ATA

VOICE CALL: BEGIN

OK

4.8 +++ Switch from data mode to command mode

Description

The command is only available during a connecting CSD call or PS data call. The +++ character sequence causes the TA to cancel the data flow over the AT interface and switch to Command Mode. This allows to enter AT commands while maintaining the data connection to the remote device.

NOTE To prevent the +++ escape sequence from being misinterpreted as data, it must be preceded and followed by a pause of at least 1000 milliseconds, and the interval between two '+' character can't exceed 900 milliseconds.

Syntax

Execution Command	Responses
+++	OK

Examples

+++
OK

4.9 ATO Switch from command mode to data mode

Description

ATO is the corresponding command to the +++ escape sequence. When there is a CSD call or a PS data call connected and the TA is in Command Mode, ATO causes the TA to resume the data and takes back to Data Mode.

SIM PIN	References
YES	V.25ter

Syntax

Execution Command	Responses

4.10 AT+CVHU Voice hang up control

Description

Write command selects whether **ATH** or “**drop DTR**” shall cause a voice connection to be disconnected or not. By voice connection is also meant alternating mode calls that are currently in voice mode.

SIM PIN	References
NO	3GPP TS 27.007

Syntax

Test Command	Responses

Read Command	Responses
AT+CVHU?	+CVHU: <mode> OK
Write Command	Responses
AT+CVHU= <mode>	OK ERROR
Execution Command	Responses
AT+CVHU	<i>Set default value:</i> OK

Defined values

<mode>
0 – “ Drop DTR ” ignored but OK response given. ATH disconnects.
1 – “ Drop DTR ” and ATH ignored but OK response given.

Examples

```
AT+CVHU=0
OK
AT+CVHU?
+CVHU: 0
OK
```

4.11 ATH Disconnect existing call

Description

The command is used to disconnect existing voice call. Before using **ATH** command to hang up a voice call, it must set **AT+CVHU=0**. Otherwise, ATH command will be ignored and “OK” response is given only.

The command is also used to disconnect CSD or PS data call, and in this case it doesn’t depend on the value of **AT+CVHU**.

SIM PIN	References

ATH
VOICE CALL:END:000017
OK

4.12 AT+CHUP Hang up call

Description

The command is used to cancel voice calls. If there is no call, it will do nothing but OK response is given. After running AT+CHUP, multiple “VOICE CALL END: ” may be reported which relies on how many calls exist before calling this command.

SIM PIN	References

4.14 AT+CRLP Radio link protocol

Description

Radio Link Protocol(RLP) parameters used when non-transparent data calls are originated may be altered with write command.

Read command returns current settings for each supported RLP version [<verX>](#). Only RLP parameters applicable to the corresponding [<verX>](#) are returned.

Test command returns values supported by the TA as a compound value. If ME/TA supports several RLP versions [<verX>](#), the RLP parameter value ranges for each [<verX>](#) are returned in a separate line.

4.15 AT+CR Service reporting control

Description

Write command controls whether or not intermediate result code “+CR: <serv>” is returned from the TA to the TE. If enabled, the intermediate result code is transmitted at the point during connect negotiation at which the TA has determined which speed and quality of service will be used, before any error control or data compression reports are transmitted, and before the intermediate result code CONNECT is transmitted.

4.16 AT+CEER Extended error report

Description

Execution command causes the TA to return the information text <report>, which should offer the user of the TA an extended report of the reason for:

- 1 the failure in the last unsuccessful call setup(originating or answering) or in-call modification.
- 2 the last call release.
- 3 the last unsuccessful GPRS attach or unsuccessful PDP context activation.

4.18 AT+VTS DTMF and tone generation

Description

The command allows the transmission of DTMF tones and arbitrary tones which cause the Mobile Switching Center (MSC) to transmit tones to a remote subscriber. The command can only be used in voice mode of operation (active voice call).

NOTE The END event of voice call will terminate the transmission of tones, and as an operator option, the tone may be ceased after a pre-determined time whether or not tone duration has been reached.

Defined values

<dtmf>

A single ASCII character in the set 0-9, *, #, A, B, C, D.

<duration>

Tone duration in 1/10 seconds, from 0 to 255. This is interpreted as a DTMF tone of different duration from that mandated by the [AT+VTD](#) command, otherwise, the duration which be set the [AT+VTD](#) command will be used for the tone (<duration> is omitted).

<dtmf-string>

A sequence of ASCII character in the set 0-9, *, #, A, B, C, D, and maximal length of the string is 29. The string must be enclosed in double quotes (“”), and separated by commas between the ASCII characters (e.g. “1,3,5,7,9,*”). Each of the tones with a duration which is set by the [AT+VTD](#) command.

4.23 AT\$0 Automatic answer

Description

The S-parameter command controls the automatic answering feature of the Module. If set to 000, automatic answering is disabled, otherwise it causes the Module to answer when the incoming call indication (RING) has occurred the number of times indicated by the specified value; and the setting will not be stored upon power-off, i.e. the default value will be restored after restart.

SIM PIN	References

001–255 Enable automatic answering on the ring number specified.

NOTE

- 1.The S-parameter command is effective on voice call and data call.
- 2.If <n> is set too high, the remote party may hang up before the call can be answered automatically.
- 3.For voice call and video call, AT+AUTOANSWER is prior to AT\$0.

Examples

```
AT$0?

OK
AT$0=003
OK
```

4.24 AT+CALM Alert sound mode

Description

The command is used to select the general alert sound mode of the device. If silent mode is selected then incoming calls will not generate alerting sounds but only the unsolicited indications RING or +CRING. The value of `<mode>` will be saved to nonvolatile memory after write command is executed.

5.8 AT+CNMA New message acknowledgement to ME/TA

Description

The command confirms successful receipt of a new message (SMS-DELIVER or SMS-STATUSREPORT) routed directly to the TE. If ME does not receive acknowledgement within required time (network timeout), it will send RP-ERROR to the network.

NOTE The execute / write command shall only be used when [AT+CSMS](#) parameter [<service>](#) equals 1 (= phase 2+) and appropriate URC has been issued by the module, i.e.:

<+CMT> for [<mt>](#)=2 incoming message classes 0, 1, 3 and none;

<+CMT> for [<mt>](#)=3 incoming message classes 0 and 3;

<+CDS> for [<ds>](#)=1.

5.9 AT+CNMI New message indications to TE

Description

The command is used to select the procedure how receiving of new messages from the network is indicated to the TE when TE is active, e.g. DTR signal is ON. If TE is inactive (e.g. DTR signal is OFF). If set `<mt>=2`, `<mt>=3` or `<ds>=1`, make sure `<mode>=1`, otherwise it will return error.

Defined values

`<mode>`

- 0 – Buffer unsolicited result codes in the TA. If TA result code buffer is full, indications can be buffered in some other place or the oldest indications may be discarded and replaced with the new received indications.
- 1 – Discard indication and reject new received message unsolicited result codes when TA-TE link is reserved (e.g. in on-line data mode). Otherwise forward them directly to the TE.
- 2 – Buffer unsolicited result codes in the TA when TA-TE link is reserved (e.g. in on-line data mode) and flush them to the TE after reservation. Otherwise forward them directly to the TE.

`<mt>`

The rules for storing received SMS depend on its data coding scheme, preferred memory storage (**AT+CPMS**) setting and this value:

- 0 – No SMS-DELIVER indications are routed to the TE.
- 1 – If SMS-DELIVER is stored into ME/TA, indication of the memory location is routed to the TE using unsolicited result code: +CMTI: **<mem3>**,**<index>**.
- 2 – SMS-DELIVERs (except class 2 messages and messages in the message waiting indication group (store message)) are routed directly to the TE using unsolicited result code:
+CMT:[**<alpha>**],**<length>**<CR><LF>**<pdu>** (PDU mode enabled); or
+CMT:**<oa>**,[**<alpha>**],**<scts>**[,**<tooa>**,**<fo>**,**<pid>**,**<dcsc>**,**<sca>**,**<tosca>**,**<length>**]
<CR> <LF>**<data>**
(text mode enabled, about parameters in italics, refer command Show Text Mode Parameters **AT+CSDH**).
- 3 – Class 3 SMS-DELIVERs are routed directly to TE using unsolicited result codes defined in **<mt>**=2. Messages of other data coding schemes result in indication as defined in **<mt>**=1.

<bm>

The rules for storing received CBMs depend on its data coding scheme, the setting of Select CBM Types (**AT+CSCB**) and this value:

- 0 – No CBM indications are routed to the TE.
- 2 – New CBMs are routed directly to the TE using unsolicited result code:
+CBM: **<length>**<CR><LF>**<pdu>** (PDU mode enabled); or
+CBM: **<sn>**,**<mid>**,**<dcsc>**,**<page>**,**<pages>**<CR><LF>**<data>** (text mode enabled)

<ds>

- 0 – No SMS-STATUS-REPORTs are routed to the TE.
- 1 – SMS-STATUS-REPORTs are routed to the TE using unsolicited result code:
+CDS: **<length>**<CR><LF>**<pdu>** (PDU mode enabled); or
+CDS: **<fo>**,**<mr>**,[**<ra>**],[**<tora>**],**<scts>**,**<dt>**,**<st>** (text mode enabled)
- 2 – If SMS-STATUS-REPORT is stored into ME/TA, indication of the memory location is routed to the TE using unsolicited result code: +CDSI: **<mem3>**,**<index>**.

<bfr>

- 0 – TA buffer of unsolicited result codes defined within this command is flushed to the TE when **<mode>** 1 to 3 is entered (OK response shall be given before flushing the codes).
- 1 – TA buffer of unsolicited result codes defined within this command is cleared when **<mode>** 1 to 3 is entered.

<index>

Integer type; value in the range of location numbers supported by the associated memory and start with zero.

<oa>

Originating-Address, Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set, type of address given by <tooa>.

<da>

Destination-Address, Address-Value field in string format; BCD numbers (or GSM 7 bit default alphabet characters) are converted to characters of the currently selected TE character set, type of address given by <toda>.

<alpha>

String type alphanumeric representation of `<da>` or `<oa>` corresponding to the entry found in MT phonebook; implementation of this feature is manufacturer specific; used character set should be the one selected with command Select TE Character Set [AT+CSCS](#).

`<scts>`

TP-Service-Centre-Time-Stamp in time-string format (refer `<dt>`).

`<toa>`

TP-Originating-Address, Type-of-Address octet in integer format. (default refer `<toda>`).

`<toda>`

TP-Destination-Address, Type-of-Address octet in integer format. (when first character of `<da>` is + (IRA 43) default is 145, otherwise default is 129).

`<length>`

Integer type value indicating in the text mode ([AT+CMGF=1](#)) the length of the message body `<data>` in characters; or in PDU mode ([AT+CMGF=0](#)), the length of the actual TP data unit in octets. (i.e. the RP layer SMSC address octets are not counted in the length)

`<data>`

In the case of SMS: TP-User-Data in text mode responses; format:

1. If `<dcs>` indicates that GSM 7 bit default alphabet is used and `<fo>` indicates that TP-User-Data-Header-Indication is not set:
 - a. If TE character set other than "HEX": ME/TA converts GSM alphabet into current TE character set.
 - b. If TE character set is "HEX": ME/TA converts each 7-bit character of GSM 7 bit default alphabet into two IRA character long hexadecimal number. (e.g. character Π (GSM 7 bit default alphabet 23) is presented as 17 (IRA 49 and 55))
2. If `<dcs>` indicates that 8-bit or UCS2 data coding scheme is used, or `<fo>` indicates that TP-User-Data-Header-Indication is set: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number. (e.g. octet with integer value 42 is presented to TE as two characters 2A (IRA 50 and 65))
3. If `<dcs>` indicates that GSM 7 bit default alphabet is used:
 - a. If TE character set other than "HEX": ME/TA converts GSM alphabet into current TE character set.
 - b. If TE character set is "HEX": ME/TA converts each 7-bit character of the GSM 7 bit default alphabet into two IRA character long hexadecimal number.
4. If `<dcs>` indicates that 8-bit or UCS2 data coding scheme is used: ME/TA converts each 8-bit octet into two IRA character long hexadecimal number.

`<fo>`

Depending on the Command or result code: first octet of GSM 03.40 SMS-DELIVER, SMS-SUBMIT (default 17), SMS-STATUS-REPORT, or SMS-COMMAND (default 2) in integer format. SMS status report is supported under text mode if `<fo>` is set to 49.

`<mr>`

Message Reference

GSM 03.40 TP-Message-Reference in integer format.

`<ra>`

Recipient Address

GSM 03.40 TP-Recipient-Address Address-Value field in string format;BCD numbers (or GSM default alphabet characters) are converted to characters of the currently selected TE character set(refer to command [AT+CSCS](#));type of address given by [<tora>](#)

[<tora>](#)

Type of Recipient Address

GSM 04.11 TP-Recipient-Address Type-of-Address octet in integer format (default refer [<toda>](#))

[<dt>](#)

Discharge Time

GSM 03.40 TP-Discharge-Time in time-string format:"yy/MM/dd,hh:mm:ss+zz",where characters indicate year (two last digits),month,day,hour,minutes,seconds and time zone.

6.2 AT+COPS Operator selection

Description

Write command forces an attempt to select and register the GSM/UMTS network operator. <mode> is used to select whether the selection is done automatically by the ME or is forced by this command to operator <oper> (it shall be given in format <format>). If the selected operator is not available, no other operator shall be selected (except <mode>=4). The selected operator name format shall apply to further read commands (AT+COPS?) also. <mode>=2 forces an attempt to deregister from the network. The selected mode affects to all further network registration (e.g. after <mode>=2, ME shall be unregistered until <mode>=0 or 1 is selected).

Read command returns the current mode and the currently selected operator. If no operator is selected, <format> and <oper> are omitted.

Test command returns a list of quadruplets, each representing an operator present in the network. Quadruplet consists of an integer indicating the availability of the operator <stat>, long and short alphanumeric format of the name of the operator, and numeric format representation of the operator. Any of the formats may be unavailable and should then be an empty field. The list of operators shall be in order: home network, networks referenced in SIM, and other networks.

It is recommended (although optional) that after the operator list TA returns lists of supported <mode>s and <format>s. These lists shall be delimited from the operator list by two commas. When executing AT+COPS=? , any input from serial port will stop this command.

6.5 AT+CLIP Calling line identification presentation

Description

The command refers to the GSM/UMTS supplementary service CLIP (Calling Line Identification Presentation) that enables a called subscriber to get the calling line identity (CLI) of the calling party when receiving a mobile terminated call.

Write command enables or disables the presentation of the CLI at the TE. It has no effect on the execution of the supplementary service CLIP in the network.

When the presentation of the CLI at the TE is enabled (and calling subscriber allows), +CLIP: <number>,<type>,,[<alpha>][,<CLI validity>]] response is returned after every RING (or +CRING: <type>; refer sub clause "Cellular result codes +CRC") result code sent from TA to TE. It is manufacturer specific if this response is used when normal voice call is answered.

- 2 – unknown (e.g. no network, etc.)

<number>

String type phone number of calling address in format specified by <type>.

<type>

Type of address octet in integer format;

- 128 – Restricted number type includes unknown type and format
- 145 – International number type
- 161 – national number. The network support for this type is optional
- 177 – network specific number, ISDN format
- 129 – Otherwise

<alpha>

String type alphanumeric representation of <number> corresponding to the entry found in phone book.

<CLI validity>

- 0 – CLI valid
- 1 – CLI has been withheld by the originator
- 2 – CLI is not available due to interworking problems or limitations of originating network

Examples

6.6 AT+CLIR Calling line identification restriction

Description

The command refers to CLIR-service that allows a calling subscriber to enable or disable the presentation of the CLI to the called party when originating a call.

Write command overrides the CLIR subscription (default is restricted or allowed) when temporary mode is provisioned as a default adjustment for all following outgoing calls. This adjustment can be revoked by using the opposite command.. If this command is used by a subscriber without provision of CLIR in permanent mode the network will act.

Read command gives the default adjustment for all outgoing calls (given in <n>), and also triggers an interrogation of the provision status of the CLIR service (given in <m>).

Test command returns values supported as a compound value.

6.7 AT+COLP Connected line identification presentation

Description

The command refers to the GSM/UMTS supplementary service COLP(Connected Line Identification Presentation) that enables a calling subscriber to get the connected line identity (COL) of the called party after setting up a mobile originated call. The command enables or disables the presentation of the COL at the TE. It has no effect on the execution of the supplementary service COLR in the network.

When enabled (and called subscriber allows), +COLP:<number>, <type> [,<subaddr>, <satype> [,<alpha>]] intermediate result code is returned from TA to TE before any +CR responses.

When the AT+COLP=1 is set, any data input immediately after the launching of “ATDXXX;” will stop the execution of the ATD command, which may cancel the establishing of the call.

6.10 AT+CCWA Call waiting

Description

The command allows control of the Call Waiting supplementary service. Activation, deactivation and status query are supported. When querying the status of a network service (<mode>=2) the response line for 'not active' case (<status>=0) should be returned only if service is not active for any <class>. Parameter <n> is used to disable/enable the presentation of an unsolicited result code +CCWA: <number>,<type>,<class>,[<alpha>],[<CLI validity>] to the TE when call waiting service is enabled. Command should be abortable when network is interrogated.

6.11 AT+CHLD Call related supplementary services

Description

The command allows the control of the following call related services:

1. A call can be temporarily disconnected from the ME but the connection is retained by the network.
2. Multiparty conversation (conference calls).
3. The served subscriber who has two calls (one held and the other either active or alerting) can connect the other parties and release the served subscriber's own connection.

Calls can be put on hold, recovered, released, added to conversation, and transferred.

6.12 AT+CUSD Unstructured supplementary service data

Description

The command allows control of the Unstructured Supplementary Service Data (USSD). Both network and mobile initiated operations are supported. Parameter <n> is used to disable/enable the presentation of an unsolicited result code (USSD response from the network, or network initiated operation) +CUSD: <m>[,<str>,<dc>] to the TE. In addition, value <n>=2 is used to cancel an ongoing USSD session.

6.13 AT+CAOC Advice of charge

Description

The refers to Advice of Charge supplementary service that enables subscriber to get information about the cost of calls. With `<mode>=0`, the execute command returns the current call meter value from the ME.

The command also includes the possibility to enable an unsolicited event reporting of the CCM information. The unsolicited result code +CCCM: `<ccm>` is sent when the CCM value changes, but not more that every 10 seconds. Deactivation of the unsolicited event reporting is made with the same command.

6.14 AT+CSSN Supplementary service notifications

Description

The command refers to supplementary service related network initiated notifications. The set command enables/disables the presentation of notification result codes from TA to TE.

When **<n>**=1 and a supplementary service notification is received after a mobile originated call setup, intermediate result code +CSSI: **<code1>**[**<index>**] is sent to TE before any other MO call setup result codes presented in the present document. When several different **<code1>**s are received from the network, each of them shall have its own +CSSI result code.

When **<m>**=1 and a supplementary service notification is received during a mobile terminated call setup or during a call, or when a forward check supplementary service notification is received, unsolicited result code +CSSU: **<code2>**[**<index>**][**<number>**][**<type>**][**<subaddr>**][**<satype>**]]] is sent to TE. In case of MT call setup, result code is sent after every +CLIP result code (refer command "Calling line identification presentation +CLIP") and when several different **<code2>**s are received from the network, each of them shall have its own +CSSU result code.

Defined values

<onoff>

Integer type value indicating:

- 0 – Disable automatic time zone update via NITZ (default).
- 1 – Enable automatic time zone update via NITZ.

NOTE 1. The value of <onoff> is nonvolatile, and factory value is 0.

2. For automatic time and time zone update is enabled (+CTZU=1):

If time zone is only received from network and it doesn't equal to local time zone (AT+CCLK), time zone is updated automatically, and real time clock is updated based on local time and the difference between time zone from network and local time zone (Local time zone must be valid).

If Universal Time and time zone are received from network, both time zone and real time clock is updated automatically, and real time clock is based on Universal Time and time zone from network.

Defined values

<onoff>

Integer type value indicating:

- 0 – Disable time zone change event reporting (default).
- 1 – Enable time zone change event reporting.

+CTZV: <tz>[,<time>][,<dst>]

Unsolicited result code when time zone received from network doesn't equal to local time zone, and if the informations from network don't include date and time, time zone will be only reported, and if network daylight saving time is present, it is also reported. For example:

- +CTZV: 32 *(Only report time zone)*
- +CTZV: 32,1 *(Report time zone and network daylight saving time)*
- +CTZV: 32,08/12/09,17:00:00 *(Report time and time zone)*
- +CTZV: 32,08/12/09,17:00:00,1 *(Report time, time zone and daylight saving time)*

For more detailed informations about time and time zone, please refer 3GPP TS 24.008.

<tz> Local time zone received from network.

<time> Universal time received from network, and the format is “yy/MM/dd,hh:mm:ss”,

where characters indicate year (two last digits), month, day, hour, minutes and seconds.

<dst> Network daylight saving time, and if it is received from network, it indicates the value that has been used to adjust the local time zone. The values as following:

- 0 – No adjustment for Daylight Saving Time.
- 1 – +1 hour adjustment for Daylight Saving Time.
- 2 – +2 hours adjustment for Daylight Saving Time.

NOTE Herein, <time> is Universal Time or NITZ time, but not local time.

Defined values

<count>
the count of arfcn.
<s>
starting channel.
<e>
ending channel.
<arfcn_value>
carrier assigned radio channel (BCCH – Broadcast Control Channel).
<bsic_value>
base station identification code.
<dBm_value>
the value of dBm.
<mcc_value>
mobile country code.
<mnc_value>
mobile network code.
<lac_value>
localization area code.
<cellId>
cell identifier.
<cellStatus>
cell status, this parameter indicates the following statuses:
- CELL_SUITABLE indicates the C0 is a suitable cell.
- CELL_LOW_PRIORITY indicates the cell is low priority based on the system information received.
- CELL_FORBIDDEN indicates the cell is forbidden.
- CELL_BARRED indicates the cell is barred based on the system information received.
- CELL_LOW_LEVEL indicates the cell RXLEV is low.
- CELL_OTHER indicates none of the above, e.g. exclusion timer running, no BCCH available etc.
<num_arfcn>
number of valid channels.
<list of arfcs>
list arfcs BCCH allocation, and the total number is <num_arfcn>.

<num_channel>

number of valid channels.

<list of channels>

list channels, and the total number is <num_channels>.

<arfcn_index>

the index of arfcn, and the minimum value is zero.

7.1 +CME ERROR Mobile Equipment error result code

Description

The operation of +CME ERROR:<err> result code is similar to the regular ERROR result code: if +CME ERROR: <err> is the result code for any of the commands in a command line, none of the following commands in the same command line is executed (neither ERROR nor OK result code shall be returned as a result of a completed command line execution). The format of <err> can be either numeric or verbose. This is set with command [AT+CMEE](#).

```

7.4 AT+CFUN Set phone functionality

Description

The command selects the level of functionality **<fun>** in the ME. Level "full functionality" is where the highest level of power is drawn. "Minimum functionality" is where minimum power is drawn. Level of functionality between these may also be specified by manufacturers. When supported by manufacturers, ME resetting with **<rst>** parameter may be utilized.

NOTE **AT+CFUN=6** must be used after setting **AT+CFUN=7**.

Defined values

<fun>
0 – minimum functionality
1 – full functionality, online mode
4 – disable phone both transmit and receive RF circuits
5 – Factory Test Mode

- 6 – Reset
- 7 – Offline Mode

<rst>

- 0 – do not reset the ME before setting it to <fun> power level
- 1 – reset the ME before setting it to <fun> power level. This value only takes effect when <fun> equals 1.

Examples

```
AT+CFUN?
```

```
+CFUN: 1
```

```
OK
```

```
AT+CFUN=0
```

```
OK
```

7.5 AT+CPIN Enter PIN

Description

The command sends to the ME a password which is necessary before it can be operated (SIM PIN, SIM PUK, PH-SIM PIN, etc.). If the PIN is to be entered twice, the TA shall automatically repeat the PIN. If no PIN request is pending, no action is taken towards MT and an error message, +CME b is returned to TE.

If the PIN required is SIM PUK or SIM PUK2, the second pin is required. This second pin, <newpin>, is used to replace the old pin in the SIM.

Defined values

<time>

String type value; format is “yy/MM/dd,hh:mm:ss±zz”, where characters indicate year (two last digits), month, day, hour, minutes, seconds and time zone (indicates the difference, expressed in quarters of an hour, between the local time and GMT; three last digits are mandatory, range -47...+48). E.g. 6th of May 2008, 14:28:10 GMT+8 equals to “08/05/06,14:28:10+32”.

NOTE

1. Time zone is nonvolatile, and the factory value is invalid time zone.
2. Command +CCLK? will return time zone when time zone is valid, and if time zone is 00, command +CCLK? will return “+00”, but not “-00”.

7.18 AT+CNVW Write NV item

Description

The **AT+CNVW** write command can be used to write **<item>** to NV(nonvolatile memory).If **<item>** is given as the only parameter,the write command may get **<item>** information.

The test command returns the range of **<item>** and the maximum length of the **<item_data>** field.

NOTE Before writing **<item>** to NV,you should get **<item>** information by **AT+CNVW=<item>** and confirm these parameters.

SIM PIN	References

Defined values

<max_item>
Maximum number of item supported by module.
<max_data_len>
Maximum length of <item_data> .
<item>
Item number in NV(nonvolatile memory).These items store some configuration of RF,Audio,etc.
<index>
Index of array.Some items is stored by array.When operating these items,you must specify the index.To other items(not stored by array),the index is 0.
<item_data>
Data(string type) that written to <item> . <item_data> is in hexadecimal format.The length of <item_data> is not more than <item_size> *2.
<presence>
Presence of item.
0 not present
1 present

<array_size>

Size of array.If <item> is stored by array,the value of <index> must be less than <array_size>.

<item_size>

Size of item.The value is given in octets.Because the format of <item_data> is hexadecimal,the length of <item_data> should be equal to <item_size>*2.

<err_code>

The error codes.These error codes are followed:

-1	Error parameters
0	Not present
1	Busy(Request is queued)
2	Bad(unrecognizable) command
3	The NVM is full
4	Command failed,reason other than NVM was full

7.20 AT+CDELTA Write delta package to FOTA partition

Description

The [AT+CDELTA](#) command can be used to write delta package to FOTA partition. After writing successfully, it will set the flag for updating. When module resets and checks the flag, then it starts to update firmware. The delta package is saved as a file in file system.

SIM PIN	References

AT+CDELTA=<delta_package>	<i>If successful,return:</i>
	+CDELTA: 1 OK
	<i>If fail,return:</i>
	+CDELTA: 0,<err_code> OK

Defined values

<delta_package>

File name of delta package (string type). <delta_package> must be double quoted.
Please refer to “NOTE” section for more detail.

<err_code>

The error code of writing delta package.

- | | |
|---|---|
| 0 | The delta package does not exist |
| 1 | Error occurs when reading delta package |
| 2 | Error occurs when writing delta package to FOTA partition |
| 3 | Set the flag of updating unsuccessfully |

Examples

```
AT+CDELTA=?
```

```
OK
```

```
AT+CDELTA="delta_1_2.mld"
```

```
+CDELTA: 1
```

```

```

NOTE:

1. Delta package can be resided in the module or T Flash card, this command will lookup the package under current directory. BTW you can use +FSCD to change current directory.
2. After the command finished one need to reset the module to start the updating process, during the process the status led will blink for attention. Please refer “SIM52xx_Delta_Package_Update_Application_note_V0.01.doc” for more detail.

7.21 AT+CDIPR Set UART baud rate

Description

The command sets UART baud rate when upgrade firmware through UART.

NOTE:

1. This command depends on which baud rate is set by AT+IPR and download tool.
2. Before using download tool to upgrade firmware through UART, one must use AT+CUDIAG to change UART service for download.
3. The baud rate will be saved as long as this command is executed.
4. Please refer to the document about download firmware through UART, in order to get more

usage of this command.

8.2 AT+CSIM Generic SIM access

Description

The command allows to control the SIM card directly.

Compared to restricted SIM access command [AT+CRSM](#), [AT+CSIM](#) allows the ME to take more control over the SIM interface.

For SIM–ME interface please refer 3GPP TS 11.11.

NOTE The SIM Application Toolkit functionality is not supported by [AT+CSIM](#). Therefore the following SIM commands can not be used: [TERMINAL PROFILE](#), [ENVELOPE](#), [FETCH](#) and [TEMINAL RESPONSE](#).

Syntax

Test Command	Responses
AT+CSIM=?	OK
Write Command	Responses
AT+CSIM= <length>,<command>	+CSIM: <length>, <response> OK ERROR +CME ERROR: <err>

Defined values

<length>
Integer type; length of the characters that are sent to TE in <command> or <response>
<command>
Command passed on by the MT to the SIM.
<response>
Response to the command passed on by the SIM to the MT.

Examples

AT+CSIM=?

8.3 AT+CRSM Restricted SIM access

Description

By using [AT+CRSM](#) instead of Generic SIM Access [AT+CSIM](#), TE application has easier but more limited access to the SIM database.

Write command transmits to the MT the SIM [<command>](#) and its required parameters. MT handles internally all SIM-MT interface locking and file selection routines. As response to the command, MT sends the actual SIM information parameters and response data. MT error result code +CME ERROR may be returned when the command cannot be passed to the SIM, but failure in the execution of the command in the SIM is reported in [<sw1>](#) and [<sw2>](#) parameters.

Defined values

<command>
Command passed on by the MT to the SIM:
176 – READ BINARY
178 – READ RECORD
192 – GET RESPONSE
214 – UPDATE BINARY
220 – UPDATE RECORD
242 – STATUS
203 – RETRIEVE DATA
219 – SET DATA
<fileID>
Identifier for an elementary data file on SIM, if used by <command> .
<p1> <p2> <p3>
Integer type; parameters to be passed on by the Module to the SIM.
<data>
Information which shall be written to the SIM(hexadecimal character format, refer AT+CSCS).
<sw1> <sw2>
Status information from the SIM about the execution of the actual command. It is returned in both cases, on successful or failed execution of the command.
<response>

Response data in case of a successful completion of the previously issued command.
 “STATUS” and “GET RESPONSE” commands return data, which gives information about the currently selected elementary data field. This information includes the type of file and its size.
 After “READ BINARY” or “READ RECORD” commands the requested data will be returned.
 <response> is empty after “UPDATE BINARY” or “UPDATE RECORD” commands.

Examples

```
AT+CRSM=?

Defined values

<findtext>

String type, this value is used to find the record.Character set should be the one selected with command **AT+CSCS**.

<index>

Integer type values in the range of location numbers of phonebook memory.

<number>

String type, phone number of format **<type>**, the maximum length is **<nlength>**.

<type>

Type of phone number octet in integer format, default 145 when dialing string includes international access code character "+", otherwise 129.

<text>

String type field of maximum length **<tlength>**; Often this value is set as name.

<nlength>

Integer type value indicating the maximum length of field **<number>**.

<tlength>

Integer type value indicating the maximum length of field **<text>**.

Defined values

<index>

Integer type values in the range of location numbers of phonebook memory.If **<index>** is not given, the first free entry will be used. If **<index>** is given as the only parameter, the phonebook entry specified by **<index>** is deleted.If record number **<index>** already exists, it will be overwritten.

<number>

String type, phone number of format **<type>**, the maximum length is **<nlength>**.It must be a non-empty string.

<type>

Type of address octet in integer format, If **<number>** contains a leading “+” **<type>** = 145 (international) is used.Supported value are:

- 145 – when dialling string includes international access code character “+”
- 161 – national number.The network support for this type is optional
- 177 – network specific number,ISDN format
- 129 – otherwise

<text>

String type field of maximum length **<tlength>**; character set as specified by command Select TE

Character Set [AT+CSCS](#).

<nlength>

Integer type value indicating the maximum length of field <number>.

<tlength>

Integer type value indicating the maximum length of field <text>.

NOTE If the parameters of <type> and <text> are omitted and the first character of <number> is '+', it will specify <type> as 145(129 if the first character isn't '+') and <text> as NULL.

Examples

```

12 File System Related Commands

The file system is used to store files in a hierarchical (tree) structure, and there are some definitions and conventions to use the Module.

Local storage space is mapped to “C:”.

NOTE General rules for naming (both directories and files):

- 1 The length of actual fully qualified names of directories and files can not exceed 245.
- 2 Directory and file names can not include the following characters:
`\ : * ? “ < > |`
- 3 Between directory name and file/directory name, use character “/” as list separator, so it can not appear in directory name or file name.
- 4 The first character of names must be a letter or a numeral or underline, and the last character can not be period “.” and oblique “/”.

12.1 AT+FSCD Select directory as current directory

15.1 AT+CGDCONT Define PDP context

Description

The set command specifies PDP context parameter values for a PDP context identified by the (local) context identification parameter `<cid>`. The number of PDP contexts that may be in a defined state at the same time is given by the range returned by the test command. A special form of the write command (`AT+CGDCONT=<cid>`) causes the values for context `<cid>` to become undefined.

Defined values

`<cid>`
(PDP Context Identifier) a numeric parameter which specifies a particular PDP context definition.

The parameter is local to the TE-MT interface and is used in other PDP context-related commands. The range of permitted values (minimum value = 1) is returned by the test form of the command.

1...16

<PDP_type>

(Packet Data Protocol type) a string parameter which specifies the type of packet data protocol.

IP Internet Protocol
PPP Point to Point Protocol
IPV6 Internet Protocol Version 6

<APN>

(Access Point Name) a string parameter which is a logical name that is used to select the GGSN or the external packet data network.

<PDP_addr>

A string parameter that identifies the MT in the address space applicable to the PDP.

Read command will continue to return the null string even if an address has been allocated during the PDP startup procedure. The allocated address may be read using command [AT+CGPADDR](#).

<d_comp>

A numeric parameter that controls PDP data compression:

0 – off (default if value is omitted)
1 – on
2 – V.42bis

<h_comp>

A numeric parameter that controls PDP header compression:

0 – off (default if value is omitted)
1 – on
2 – RFC1144
3 – RFC2507
4 – RFC3095

15.3 AT+CGEQREQ 3G quality of service profile (requested)

Description

The test command returns values supported as a compound value.

The read command returns the current settings for each defined context for which a QOS was explicitly specified.

The write command allows the TE to specify a Quality of Service Profile for the context identified by the context identification parameter **<cid>** which is used when the MT sends an Activate PDP Context Request message to the network.

A special form of the write command, **AT+CGEQREQ=<cid>** causes the requested profile for context number **<cid>** to become undefined.

Defined values

<cid>

Parameter specifies a particular PDP context definition. The parameter is also used in other PDP context-related commands.

1...16

<Traffic class>

0 – conversational

1 – streaming

2 – interactive

3 – background

4 – subscribed value

<Maximum bitrate UL>

This parameter indicates the maximum number of kbits/s delivered to UMTS(up-link traffic) at a SAP. As an example a bitrate of 32kbit/s would be specified as 32(e.g. AT+CGEQREQ=...,32,...).

0 – subscribed value

1...512

<Maximum bitrate DL>

This parameter indicates the maximum number of kbits/s delivered to UMTS(down-link traffic) at a SAP. As an example a bitrate of 32kbit/s would be specified as 32(e.g. AT+CGEQREQ=...,32,...).

0 – subscribed value

1...16000

<Guaranteed bitrate UL>

This parameter indicates the guaranteed number of kbit/s delivered to UMTS(up-link traffic) at a SAP(provided that there is data to deliver). As an example a bitrate of 32kbit/s would be specified as 32(e.g. AT+CGEQREQ=...,32,...).

0 – subscribed value

1...512

<Guaranteed bitrate DL>

This parameter indicates the guaranteed number of kbit/s delivered to UMTS(down-link traffic) at a SAP(provided that there is data to deliver). As an example a bitrate of 32kbit/s would be specified as 32(e.g. AT+CGEQREQ=...,32,...).

0 – subscribed value

1...16000

<Delivery order>

This parameter indicates whether the UMTS bearer shall provide in-sequence SDU delivery or not.

0 – no

1 – yes

2 – subscribed value

<Maximum SDU size>

This parameter indicates the maximum allowed SDU size in octets.

0 – subscribed value

10...1520 (value needs to be divisible by 10 without remainder)

<SDU error ratio>

This parameter indicates the target value for the fraction of SDUs lost or detected as erroneous. SDU error ratio is defined only for conforming traffic. As an example a target SDU error ratio of 5×10^{-3} would be specified as "5E3" (e.g. AT+CGEQREQ=..., "5E3", ...).

"0E0" – subscribed value

"1E2"

"7E3"

"1E3"

"1E4"

"1E5"

"1E6"

"1E1"

<Residual bit error ratio>

This parameter indicates the target value for the undetected bit error ratio in the delivered SDUs. If no error detection is requested, Residual bit error ratio indicates the bit error ratio in the delivered SDUs. As an example a target residual bit error ratio of 5×10^{-3} would be specified as "5E3" (e.g. AT+CGEQREQ=..., "5E3", ...).

"0E0" – subscribed value

"5E2"

"1E2"

"5E3"

"4E3"

"1E3"

"1E4"

"1E5"

"1E6"

"6E8"

<Delivery of erroneous SDUs>

This parameter indicates whether SDUs detected as erroneous shall be delivered or not.

0 – no

1 – yes

2 – no detect

3 – subscribed value

<Transfer delay>

This parameter indicates the targeted time between request to transfer an SDU at one SAP to its delivery at the other SAP, in milliseconds.

0 – subscribed value

10...150 – value needs to be divisible by 10 without remainder

200...950 – value needs to be divisible by 50 without remainder

1000...4000 – value needs to be divisible by 100 without remainder

<Traffic handling priority>

This parameter specifies the relative importance for handling of all SDUs belonging to the UMTS Bearer compared to the SDUs of the other bearers.

Q – subscribed value

Defined values

<cid>

Parameter specifies a particular PDP context definition.The parameter is also used in other PDP

context-related commands.

1...16

<Traffic class>

- 0 – conversational
- 1 – streaming
- 2 – interactive
- 3 – background
- 4 – subscribed value

<Maximum bitrate UL>

This parameter indicates the maximum number of kbits/s delivered to UMTS(up-link traffic)at a SAP.As an example a bitrate of 32kbit/s would be specified as 32(e.g. [AT+CGEQMIN=...,32,...](#)).

- 0 – subscribed value
- 1...512

<Maximum bitrate DL>

This parameter indicates the maximum number of kbits/s delivered to UMTS(down-link traffic)at a SAP.As an example a bitrate of 32kbit/s would be specified as 32(e.g. [AT+CGEQMIN=...,32,...](#)).

- 0 – subscribed value
- 1...16000

<Guaranteed bitrate UL>

This parameter indicates the guaranteed number of kbit/s delivered to UMTS(up-link traffic)at a SAP(provided that there is data to deliver).As an example a bitrate of 32kbit/s would be specified as 32(e.g. [AT+CGEQMIN=...,32,...](#)).

- 0 – subscribed value
- 1...512

<Guaranteed bitrate DL>

This parameter indicates the guaranteed number of kbit/s delivered to UMTS(down-link traffic)at a SAP(provided that there is data to deliver).As an example a bitrate of 32kbit/s would be specified as 32(e.g. [AT+CGEQMIN=...,32,...](#)).

- 0 – subscribed value
- 1...16000

<Delivery order>

This parameter indicates whether the UMTS bearer shall provide in-sequence SDU delivery or not.

- 0 – no
- 1 – yes
- 2 – subscribed value

<Maximum SDU size>

This parameter indicates the maximum allowed SDU size in octets.

- 0 – subscribed value
- 10...1520 (value needs to be divisible by 10 without remainder)

<SDU error ratio>

This parameter indicates the target value for the fraction of SDUs lost or detected as erroneous.SDU error ratio is defined only for conforming traffic.As an example a target SDU error ratio of 5×10^{-3} would be specified as “5E3”(e.g. [AT+CGEQMIN=...,“5E3”,...](#)).

"0E0" – subscribed value

"1E2"

"7E3"

"1E3"

"1E4"

"1E5"

"1E6"

"1E1"

<Residual bit error ratio>

This parameter indicates the target value for the undetected bit error ratio in the delivered SDUs. If no error detection is requested, Residual bit error ratio indicates the bit error ratio in the delivered SDUs. As an example a target residual bit error ratio of $5 \cdot 10^{-3}$ would be specified as "5E3" (e.g. [AT+CGEQREQ=..., "5E3", ...](#)).

"0E0" – subscribed value

"5E2"

"1E2"

"5E3"

"4E3"

"1E3"

"1E4"

"1E5"

"1E6"

"6E8"

<Delivery of erroneous SDUs>

This parameter indicates whether SDUs detected as erroneous shall be delivered or not.

0 – no

1 – yes

2 – no detect

3 – subscribed value

<Transfer delay>

This parameter indicates the targeted time between request to transfer an SDU at one SAP to its delivery at the other SAP, in milliseconds.

0 – subscribed value

10...150 – value needs to be divisible by 10 without remainder

200...950 – value needs to be divisible by 50 without remainder

1000...4000 – value needs to be divisible by 100 without remainder

<Traffic handling priority>

This parameter specifies the relative importance for handling of all SDUs belonging to the UMTS Bearer compared to the SDUs of the other bearers.

0 – subscribed value

1 –

2 –

3 –

<PDP_type>

(Packet Data Protocol type) a string parameter which specifies the type of packet data protocol.

IP Internet Protocol
PPP Point to Point Protocol
IPV6 Internet Protocol Version 6

Defined values

<L2P>

A string parameter that indicates the layer 2 protocol to be used between the TE and MT.

PPP Point-to-point protocol for a PDP such as IP

<cid>

A numeric parameter which specifies a particular PDP context definition (see AT+CGDCONT command).

1...16

Examples

```

Execution Command	Responses
AT+CGPADDR	[+CGPADDR: <cid>,<PDP_addr> +CGPADDR: <cid>,<PDP_addr>[...]] OK ERROR +CME ERROR: <err>

Defined values

<cid>

A numeric parameter which specifies a particular PDP context definition (see [AT+CGDCONT](#) command). If no <cid> is specified, the addresses for all defined contexts are returned.

1...16

<PDP_addr>

A string that identifies the MT in the address space applicable to the PDP. The address may be static or dynamic. For a static address, it will be the one set by the [AT+CGDCONT](#) command when the context was defined. For a dynamic address it will be the one assigned during the last PDP context activation that used the context definition referred to by <cid>. <PDP_addr> is omitted if none is available.

Examples

```
AT+CGPADDR=?
```

```
+CGPADDR: ( 1)
```

```
OK
```

```
AT+CGPADDR=1
```

```
+CGPADDR: 1,"0.0.0.0"

15.11 AT+CGEREP GPRS event reporting

Description

The write command enables or disables sending of unsolicited result codes, “+CGEV” from MT to TE in the case of certain events occurring in the Packet Domain MT or the network. [<mode>](#) controls the processing of unsolicited result codes specified within this command. [<bfr>](#) controls the effect on buffered codes when [<mode>](#) 1 or 2 is entered. If a setting is not supported by the MT, ERROR or +CME ERROR: is returned.

Read command returns the current [<mode>](#) and buffer settings.

Test command returns the modes and buffer settings supported by the MT as compound values.

SIM PIN	References
YES	3GPP TS 27.007

Syntax

Test Command	Responses
AT+CGEREP=?	+CGEREP: (list of supported <mode> s),(list of supported <bfr> s) OK
Read Command	Responses
AT+CGEREP?	+CGEREP: <mode> , <bfr>

	OK
Write Command	Responses
AT+CGEREP=	OK
<mode>[,<bfr>]	ERROR
	+CME ERROR: <err>
Execution Command	Responses
AT+CGEREP	OK

Defined values

<mode>

- 0 – buffer unsolicited result codes in the MT; if MT result code buffer is full, the oldest ones can be discarded. No codes are forwarded to the TE.
- 1 – discard unsolicited result codes when MT-TE link is reserved (e.g. in on-line data mode); otherwise forward them directly to the TE.
- 2 – buffer unsolicited result codes in the MT when MT-TE link is reserved (e.g. in on-line data mode) and flush them to the TE when MT-TE link becomes available; otherwise forward them directly to the TE.

<bfr>

- 0 – MT buffer of unsolicited result codes defined within this command is cleared when <mode> 1 or 2 is entered.
- 1 – MT buffer of unsolicited result codes defined within this command is flushed to the TE when <mode> 1 or 2 is entered (OK response shall be given before flushing the codes).

The following unsolicited result codes and the corresponding events are defined:

+CGEV: REJECT <PDP_type>, <PDP_addr>

A network request for PDP context activation occurred when the MT was unable to report it to the TE with a +CRING unsolicited result code and was automatically rejected.

+CGEV: NW REACT <PDP_type>, <PDP_addr>, [<cid>]

The network has requested a context reactivation. The <cid> that was used to reactivate the context is provided if known to the MT.

+CGEV: NW DEACT <PDP_type>, <PDP_addr>, [<cid>]

The network has forced a context deactivation. The <cid> that was used to activate the context is provided if known to the MT.

+CGEV: ME DEACT <PDP_type>, <PDP_addr>, [<cid>]

The mobile equipment has forced a context deactivation. The <cid> that was used to activate the context is provided if known to the MT.

+CGEV: NW DETACH

The network has forced a Packet Domain detach. This implies that all active contexts have been deactivated. These are not reported separately.

+CGEV: ME DETACH

The mobile equipment has forced a Packet Domain detach. This implies that all active contexts have been deactivated. These are not reported separately.

+CGEV: NW CLASS <class>

The network has forced a change of MS class. The highest available class is reported (see [AT+CGCLASS](#)).

+CGEV: ME CLASS <class>

The mobile equipment has forced a change of MS class. The highest available class is reported (see [AT+CGCLASS](#)).

Examples

```
AT+CGEREP=?
```

```
+CGEREP: (0-2),(0-1)
```

```
OK
```

```
AT+CGEREP?
```

```
+CGEREP: 0,0
```

```

```

15.12 AT+CGREG GPRS network registration status

Description

The command controls the presentation of an unsolicited result code “+CGREG: <stat>” when <n>=1 and there is a change in the MT's GPRS network registration status.

The read command returns the status of result code presentation and an integer <stat> which shows whether the network has currently indicated the registration of the MT.

SIM PIN	References

AT+CGREG?	+CGREG: <n>,<stat>[,<lac>,<ci>] OK
Write Command	Responses
AT+CGREG=<n>	OK
Execution Command	Responses
AT+CGREG	<i>Set default value:</i> OK

Defined values

<n>

- 0 – disable network registration unsolicited result code
- 1 – enable network registration unsolicited result code +CGREG: <stat>
- 2 – there is a change in the ME network registration status or a change of the network cell:
+CGREG: <stat>[,<lac>,<ci>]

<stat>

- 0 – not registered, ME is not currently searching an operator to register to
- 1 – registered, home network
- 2 – not registered, but ME is currently trying to attach or searching an operator to register to
- 3 – registration denied
- 4 – unknown
- 5 – registered, roaming

<lac>

Two byte location area code in hexadecimal format(e.g."00C3" equals 193 in decimal).

<ci>

Two byte cell ID in hexadecimal format.

15.13 AT+CGSMS Select service for MO SMS messages

Description

The write command is used to specify the service or service preference that the MT will use to send MO SMS messages.

The test command is used for requesting information on which services and service preferences can be set by using the [AT+CGSMS](#) write command

The read command returns the currently selected service or service preference.

Defined values

`<cid>`

Parameter specifies a particular PDP context definition. This is also used in other PDP context-related commands.

1...16

`<auth_type>`

Indicates the types of authentication to be used for the specified context. If CHAP is selected another parameter `<passwd>` needs to be specified. If PAP is selected two additional parameters `<passwd>` and `<user>` need to be specified.

- 0 – none
- 1 – PAP
- 2 – CHAP

`<passwd>`

Parameter specifies the password used for authentication. It is required for the authentication types PAP and CHAP.

`<user>`

Parameter specifies the user name used for authentication. It is required for the authentication type PAP.

16 TCP/IP Related Commands

16.1 AT+CGSOCKCONT Define socket PDP context

Description

The command specifies socket PDP context parameter values for a PDP context identified by the (local) context identification parameter `<cid>`. The number of PDP contexts that may be in a defined state at the same time is given by the range returned by the test command. A special form of the write command (`AT+CGSOCKCONT=<cid>`) causes the values for context `<cid>` to become undefined.

Defined values

`<cid>`
(PDP Context Identifier) a numeric parameter which specifies a particular PDP context definition.

The parameter is local to the TE-MT interface and is used in other PDP context-related commands. The range of permitted values (minimum value = 1) is returned by the test form of the command.

1...16

<PDP_type>

(Packet Data Protocol type) a string parameter which specifies the type of packet data protocol.

IP Internet Protocol

PPP Point to Point Protocol

IPV6 Internet Protocol Version 6

<APN>

(Access Point Name) a string parameter which is a logical name that is used to select the GGSN or the external packet data network.

<PDP_addr>

A string parameter that identifies the MT in the address space applicable to the PDP.

Read command will continue to return the null string even if an address has been allocated during the PDP startup procedure.

<d_comp>

A numeric parameter that controls PDP data compression:

0 – off (default if value is omitted)

1 – on

<h_comp>

A numeric parameter that controls PDP header compression:

0 – off (default if value is omitted)

1 – on

[<sock_type>](#)

a string parameter that identifies the type of transmission protocol.

TCP – Transfer Control Protocol

UDP – User Datagram Protocol

[<port>](#)

A numeric parameter that identifies the port of socket, the range of permitted values is 0 to 65535.

[<net_state>](#)

a numeric parameter that indicates the state of PDP context activation:

0 network close (deactivated)

1 network open(activated)

[<mode>](#)

a numeric parameter that module is used which mode. At present, it supports three mode, such as single-client, tcp-server and multi-client. if [<mode>](#) is 1, then [<sock_type>](#) and [<port>](#) are ignored.

- 0 single-client or tcp-server

<DelayTm>

a numeric parameter which is number of milliseconds to delay to output data of Receiving.The default value is 0.

<Ack>

a numeric parameter which sets whether reporting a string “Send ok” when sending some data as a tcp connection.

- 0 not reporting
- 1 reporting

<errMode>

a numeric parameter which sets mode of reporting error result code.

- 0 error result code with numeric values
- 1 error result code with string values

< HeaderType >

a numeric parameter that select which data header of receiving data, it only takes effect in multi-client mode.

- 0 add data header, the format is “+IPD(data length)”
- 1 add data header, the format is “+RECEIVE,<link num>,<data length>”

Create socket failed	Indicate that socket has not been created successfully.
Bind port failed	Indicate that input port is already in use.
Connect ok	Indicate that establishing a connection successfully.
Connection is already created	Indicate that a connection has been already established.
Connect fail	Indicate that establishing a connection unsuccessfully
No clients connected	Indicate that module as TCP server has no any connection.
No active client	Indicate that you should execute AT+ACTCLIENT first and select a connection.
Client index overflow	Indicate that input client's index is out of

	range.
Connection disconnected	Indicate that the remote end has closed the connection.
Socket closed	Indicate that socket is closed.
Network closed	Indicate that the write command of AT+NETCLOSE has excuted successfully.
Network is already closed	Indicate that network has been closed now.

17 SIM Application Toolkit (SAT) Commands

17.1 AT+STIN SAT Indication

Description

Every time the SIM Application issues a Proactive Command, via the ME, the TA will receive an indication. This indicates the type of Proactive Command issued.

AT+STGI must then be used by the TA to request the parameters of the Proactive Command from the ME. Upon receiving the **+STGI** response from the ME, the TA must send **AT+STGR** to confirm the execution of the Proactive Command and provide any required user response, e.g. a selected menu item.

17.2 AT+STGI Get SAT information

Description

Regularly this command is used upon receipt of an URC "+STIN" to request the parameters of the Proactive Command. Then the TA is expected to acknowledge the AT+STGI response with AT+STGR to confirm that the Proactive Command has been executed. AT+STGR will also provide any user information, e.g. a selected menu item. The Proactive Command type value specifies to which "+STIN" the command is related.

18 Internet Service Command

18.1 Simple mail transfer protocol service

18.1.1 AT+SMTPSRV SMTP server address and port number

Description

The synchronous command is used to set SMTP server address and server's port number. SMTP client will initiate TCP session with the specified server to send an e-mail. If the process of sending an e-mail is ongoing, the command will return "ERROR" directly.

Read command returns current SMTP server address and port number.

Execution command will clear SMTP server address and set the port number as default value.

NOTE After an e-mail is sent successfully or unsuccessfully, SMTP server address and port number won't be cleared.

Syntax

Test Command	Responses
AT+SMTPSRV=?	+SMTPSRV: (list of supported <port>s) OK
Read Command	Responses
AT+SMTPSRV?	+SMTPSRV: <server>, <port> OK
Write Command	Responses
AT+SMTPSRV=<server> [, <port>]	OK
Execution Command	Responses
AT+SMTPSRV	OK

Defined values

<server>

SMTP server address, non empty string with double quotes, mandatory and ASCII text string up to 128 characters.

<port>

Port number of SMTP server in decimal format, from 1 to 65535, and default port is 25 for SMTP.

Examples

```
AT+SMTPSRV="smtp.server.com",25
```

```
OK
```

```

AT+SMTPSRV?
+SMTPSRV: "smtp.server.com", 25
OK
AT+SMTPSRV

```

18.1.2 AT+SMTPAUTH SMTP server authentication

Description

The synchronous command is used to control SMTP authentication during connection with SMTP server. If SMTP server requires authentication while logging in the server, TE must set the authentication control flag and provide user name and password correctly before sending an e-mail. If the process of sending an e-mail is ongoing, the command will return “ERROR” directly.

Read command returns current SMTP server authentication control flag, if the flag is 0, both <user> and <pwd> are empty strings.

Execution Command cancels SMTP server authentication and clear user name and password.

NOTE After an e-mail is sent successfully or unsuccessfully, server authentication won't be cleared.

Defined values

<flag>
SMTP server authentication control flag, integer type.
0 – SMTP server doesn't require authentication, factory value.

1 – SMTP server requires authentication.

<user>

User name to be used for SMTP authentication, non empty string with double quotes and up to 128 characters.

<pwd>

Password to be used for SMTP authentication, string with double quotes and up to 128 characters.

NOTE If <flag> is 0, <user> and <pwd> must be omitted (i.e. only <flag> is present).

18.1.3 AT+SMTPFROM Sender address and name

Description

The synchronous command is used to set sender's address and name, which are used to construct e-mail header. The sender's address must be correct, and if the process of sending an e-mail is ongoing, the command will return "ERROR" directly.

Read command returns current sender's address and name.

Execution command will clear sender's address and name.

NOTE After an e-mail is sent successfully or unsuccessfully, sender address and name won't be cleared.

Defined values

<saddr>

E-mail sender address (MAIL FROM), non empty string with double quotes, mandatory and ASCII text up to 128 characters. <saddr> will be present in the header of the e-mail sent by SMTP client in the field: "From: ".

<sname>

E-mail sender name, string with double quotes, and alphanumeric ASCII text up to 64 characters. <sname> will be present in the header of the e-mail sent by SMTP client in the field: "From: ".

Examples

```
AT+SMTPFROM="senderaddress@server.com","sendername"

18.1.4 AT+SMTPRCPT Recipient address and name (TO/CC/BCC)

Description

The synchronous command is used to set recipient address/name and kind (TO/CC/BCC). If only the parameter of "kind" is present, the command will clear all recipients of this kind, and if only parameters of "kind" and "index" are present, the command will clear the specified recipient. If the process of sending an e-mail is ongoing, the command will return "ERROR" directly.

Read command returns current recipient address/name and kind list.

Execution command will clear all recipient information.

NOTE After an e-mail is sent successfully, all recipients will be cleared, if unsuccessfully, they won't be cleared.

Defined values

<kind>

Recipient kind, the kinds of TO and CC are used to construct e-mail header in the field: "To: " or "Cc: ".

- 0 – TO, normal recipient.
- 1 – CC, Carbon Copy recipient.
- 2 – BCC, Blind Carbon Copy recipient.

<index>

Index of the kind of recipient, decimal format, and from 0 to 4.

<raddr>

Recipient address, non empty string with double quotes, and up to 128 characters.

<rname>

Recipient name, string type with double quotes, and up to 64 characters.

Examples

```

18.1.6 AT+SMTPBODY E-mail body

Description

The command is used to set e-mail body, which will be sent to SMTP server with text format.

Read command returns current e-mail body. If the process of sending an e-mail is ongoing, the command will return "ERROR" directly.

Execute command will switch the serial port from command mode to data mode, so TE can enter more ASCII text as e-mail body (up to 5120), and CTRL-Z (ESC) is used to finish (cancel) the input operation and switch the serial port back to command mode.

NOTE After an e-mail is sent successfully, the body will be cleared, if unsuccessfully, it won't be cleared.

18.1.7 AT+SMTPFILE Select attachment

Description

The synchronous command is used to select file as e-mail attachment. If the process of sending an e-mail is ongoing, the command will return "ERROR" directly.

Read command returns current all selected attachments with full path.

Execute command will clear all attachments.

NOTE After an e-mail is sent successfully, attachment will be cleared, if unsuccessfully, it won't be cleared. The same file can't be selected twice.

Defined values

<index>

Index for attachments, from 1 to 10. According to the sequence of <index>, SMTP client will encode and send all attachments.

<filename>

String type with double quotes, the name of a file which is under current directory (refer to file

system commands). SMTP client doesn't allow two attachments with the same file name.

<filesize>

File size in decimal format. The total size of all attachments can't exceed 10MB.

Examples

```
AT+SMTPFILE=1,"file1.txt"
```

```
OK
```

```

18.1.8 AT+SMTPSEND Initiate session and send e-mail

Description

The asynchronous command is used to initiate TCP session with SMTP server and send an e-mail after all mandatory parameters have been set correctly. After SMTP client has connected with specified SMTP server and SMTP client receives an indication that indicates SMTP server is working well, the command will return "+SMTP: OK", but it doesn't indicate that the e-mail is already sent successfully.

After the e-mail is sent and the session is closed, an Unsolicited Result Code (URC) will be returned to TE, "+SMTP: SUCCESS" indicates the e-mail is sent successfully, and other URCs indicate an failed result and the session is closed.

Syntax

Test Command	Responses
AT+POP3GET=?	OK
Write Command	Responses
AT+POP3GET=<msg_id>,[<get_type>]	OK +POP3: <code> <mail_dir>, <mail_file> +POP3: <code> ERROR

Defined values

<msg_id>	
The e-mail's ID.	
<mail_dir>	
The directory for e-mail and attachment, string type without double quotes and the format is "YYMMDDHHMMSS" which is generated according to module's RTC.	
According to the setting of command +FSLOCA (refer to file system commands), TE can select the location (local file system or storage card) in which POP3 client saves e-mail file and attachment.	
<mail_file>	
The file to save e-mail's header and body, string type without double quotes. Usually, this file name is "EMAIL000.TXT", and if e-mail includes an attachment whose name is the same as the e-mail file, the number in the e-mail file name will be increase by 1, e.g. "EMAIL001.TXT", "EMAIL002.TXT".	
<code>	
NETWORK ERROR	Network is bad for sending or receiving data to POP3 server.
SERVER ERROR	POP3 server released the session.
	POP3 server rejects the operation with wrong response.
	POP3 server doesn't give POP3 client a response in time.

FILE SYSTEM ERROR	POP3 client gives wrong e-mail's ID. File system is bad for saving e-mail or attachment, storage space isn't enough, or storage card is pulled out. If POP3 client encounters this error, POPE client will close the session with POP3 server.
SUCCESS	POP3 client gets an e-mail from POP3 server successfully.
FAILURE	POP3 client gets an e-mail unsuccessfully.
<get_type>	
The type to save when getting message from POP3 server:	
1 – Save parsed body file and attachments 2 – Save the whole message as a “.eml” file. 3 – Save the parsed body file, attachments and eml file.	

Examples

```

AT+POP3GET=1

21.1 AT+CGPS Start/stop GPS session

Description

The command is used to start or stop GPS session.

- NOTE**
1. Output of NMEA sentences is automatic; no control via AT commands is provided. You can configure NMEA or UART port for output by using [AT+CGPSSWITCH](#). At present only support standalone mode. If executing [AT+CGPS=1](#), the GPS session will choose cold or hot start automatically.
 2. UE-based and UE-assisted mode depends on URL ([AT+CGPSURL](#)) and certificate ([AT+CGPSSSL](#)). When UE-based mode failing, it will switch standalone mode.
 3. UE-assisted mode is single fix. Standalone and UE-based mode is consecutive fix.

22.3 File transmission flow

The Module supports to transmit files from the Module to PC host and from PC host to the Module over Xmodem protocol. During the process of transmission, it can not emit any AT commands to do other things.

22.3.1 File transmission to PC host

Step1. Select file for transmission to PC host

After HyperTerminal is OK for emitting AT commands, it must select a file by one of following methods:

- ①. Select directory as current directory by [AT+FSCD](#), and then select file with parameter [<dir_type>](#) of [AT+CTXFILE](#) is 0 or omitted. [Figure 17-1]

Figure 17-1 Select file for transmission

②. Select the file directly with subparameter `<dir_type>` of `AT+CTXFILE` is not 0 and not omitted; this method is a shortcut method for limited directories. [Figure 17-2]

Figure 17-2 Select file directly for transmission

Step2. Open “Receive File” dialog box

After select transmitted file successfully, use “Transfer>Receive File...” menu to open “Receive File” dialog box in HyperTerminal. [Figure 17-3]

Figure 17-3 Open "Receive File" dialog box

Step3. Set storage place and receiving protocol

In "Receive File" dialog box, set the storage place in PC host where file transmitted is saved in text box, and select receiving protocol in combo box.

Then click "Receive" button to open "Receive Filename" dialog box. [Figure 17-4]

NOTE The receiving protocol must be "Xmodem" protocol.

Step4. Set file name

In “Receive Filename” dialog box, input file name in “Filename” text box. And then click “OK” button to start transmitting file. [Figure 17-5]

Figure 17-5 Set file name

Step5. Transmit the file

After start file transmission, it can't emit any AT commands until transmission stops. In “Xmodem file receive” dialog box, it will display the process of transmission. [Figure 17-6]

Figure 17-6 Xmodem file receive

If cancel the transmission, HyperTerminal will prompt “Transfer cancelled by user”. [Figure 17-7]

Figure 17-7 Cancel transmission

After transmission successfully, the receiving dialog box is closed and it can emit AT commands in HyperTerminal. [Figure 17-8]

22.3.2 File received from PC host

Step1. Set file name and storage place

Firstly, it must set file name and storage place in file system of module by one of following methods:

①. Select directory as current directory by **AT+FSCD**, and then set file name and storage place as current directory with parameter **<dir_type>** of **AT+CRXFILE** is 0 or omitted. [Figure 17-9]

②. Set storage place directly with parameter `<dir_type>` of `AT+CTXFILE` is not 0 and not omitted; this method is a shortcut method for limited directories.

Step2. Open “Send File” dialog box

After set file name and storage place successfully, use “Transfer>Send File...” menu to open “Send File” dialog box in HyperTerminal. [Figure 17-10]

Figure 17-10 Open “Send File” dialog box

Step3. Select file and transmitting protocol

In “Send File” dialog box, select the file to be transmitted in text box, and select the transmitting protocol in combo box. Then click “Send” button to start transmission. [Figure 17-11]

NOTE The transmitting protocol must be “Xmodem” protocol.

Figure 17-11 Select file and protocol

Step4. File transmission

After start file transmission, it can't emit any AT commands until transmission stops. In "Xmodem file send" dialog box, it will display the process of transmission. [Figure 17-12]

Figure 17-12 The process of file transmission

If cancel the transmission, HyperTerminal will prompt "Transfer cancelled by user".

NOTE There may be some characters reported which denote interactions between module and PC host.
